                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a crystalline polypeptide (1), comprising the catalytic domain of human Lymphocyte Cell Kinase (Lck) protein. Lck is a Src-family protein tyrosine kinase expressed primarily in T-cells and plays an essential role in immune response. (I) is useful for identifying a compound which is an inhibitor of human Lck protein. The present sequence is a mutated fragment of the human Lck sequence, which approximately comprises the catalytic domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "Wild-type D substituted with N. This position 364 in the full-length sequence (see ABR56202 for the wild-type full length sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New crystalline polypeptide comprising ligand binding domain or cataly domain of Lck protein, for determining three-dimensional structure of catalytic domain of Lck, has predetermined unit cell parameters.
                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                       Human, protein co-ordinate data, Lymphocyte Cell Kinase, Lck, enzyme,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "Wild-type D substituted with N. This position is 364 in the full-length sequence (see ABR56202 for the wild-type full length sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a crystalline polypeptide (I), comprising the catalytic domain of human Lymphocyte Cell Kinase (Lck) protein. Lck is a Src-family protein tyrosine kinase expressed primarily in T-cells and plays an essential role in immune response. (I) is useful for identifying a compound which is an inhibitor of human Lck protein. The present sequence is a mutated fragment of the human Lck sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Loew A;

The inversion changes be actived to the formulation of formulae (1)-(VII) given in the specification. Also included are a system for fitting compounds in binding sites of protein kinases (comprising an electronic kinase scaffold, and a scaffold library computer of protein kinases (VII), where the scaffold library is embedded in a computer device and the electronic representations of the compounds can be selectively retrieved and functionally connected with computer software adapted to it electronic representations of a kinase (compounds in an electronic adapted to retrieved and functionally connected with computer software adapted to it electronic representations of a kinase (compounds in an electronic corresponds in a binding site of a kinase), obtaining if a derivative confidence of (1)-(VII) binds to the kinase with greater affinity and/or specificity than (VII), developing ligands specific for a particular kinase (which comprises determining if a derivative of (1)-(VII) that binds to the kinase with greater affinity and/or comprises has greater for specificity for the particular kinase than (1)-(VII), developing ligands specific for a particular kinase (which comprises has greater for specificity for the particular kinase than (1)-(VII), developing ligands binding to a kinase (which comprises of the scaffolds, that, when modified, change the binding affinity and/or specificity between the scaffold and kinase and synthesizing a ligand in which at least I chemical structure of the scaffold in a smoothied).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            developing ligands with increased specificity on a kinase (which comprises testing a derivative of a kinase binding compound (1)-(VII) for increased specificity on the kinase), identifying a ligand binding to a kinase (which comprises determining if a derivative compound including a core structure (1)-(VII) binds to the kinase with changed binding a faffinity and/or specificity), a co-crystal of a kinase and a binding compound (1)-(VII), preparation of co-crystals of Pin-1 with (1)-(VII), identifying potential kinase binding compounds (which comprises fitting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention relates to a new kinase scaffold library comprises at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       electronic representations of (I)-(VII) in an electronic representation of a kinase binding site), attaching a kinase binding compound to an attachment component (which comprises identifying energetically allowed sites for attachment of the component on a kinase binding compound (I)-(VII) and attaching the compound or derivative to the attachment component at the allowed site), modified compounds (comprising (I)-(VIII)
                                                                                                                                                         Kinase; protein co-ordinate data; protein structure; cancer; cytostatic;

WPI; 2000-136321/12 N-PSDB; AAZ86794 Nucleic acids encoding a human protein kinase homolog useful for preventing, diagnosing and treating cancer, autoimmune/inflammatory disorders and reproductive defects.

Claim 1; Col 47-50; 38pp; English.

This sequence represents a human protein kinase homolog (PKH) of the invention. The PKH sequences may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PKH expression such as cancers, autoimmune/inflammatory disorders and reproductive defects. They may be used to treat disorders associated with decreased PKH expression such as cancers (e.g. lymphoma, melanoma and cancers of the

```
and quantitate the presence of similar nucleic acid sequences in samples, and hence which patients may be in need of restorative therapy. They may also be used to study the expression and function of PKH polypeptides and their role in metabolism. The PKH polypeptides may be used as antigens in the production of antibodies against PKH and in assays to identify modulators (agonists and antagonists) of PKH expression and activity. The
                    asthma and diabetes mellitus, and reproductive defects (e.g. infertility, ovulatory defects, endometriosis and polycystic ovary syndrome). The DNA may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of PKH by expressing inactive proteins or to supplement the patients own production of PKH polypeptides. Additionally, the DNA may be used to production of PKH polypeptides. Additionally, the DNA may be used to produce PKH, according to standard recombinant DNA methodology, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. Conversely, antisense nucleic acid molecules may be administered to down regulate PKH expression by binding with the cells own PKH genes and preventing their expression. The DNA, and antisense sequences may also be used as DNA probes in diagnostic assays to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                anti-PKH antibodies and PKH antagonists may also be used to down regulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PKH expression and activity. The anti-PKH antibodies may also be used as diagnostic agents for detecting the presence of PKH polypeptides in
   breast lung and prostate), autoimmune/inflammatory disorders (e.g. AIDS

Human protein kinase proteins and homologs, useful for preventing, diagnosing and treating cancers, autoimmune/inflammatory disorders and reproductive disorders.

Claim 1; Col 47-50; 38pp; English

The present sequence is human protein kinase homolog-3 (PKH-3). Human protein kinase homologs (PKH) and their cDNA molecules are used in the prevention, diagnosis and treatment of diseases associated with increased or decreased expression of PKH. Examples of such disorders include, cancer (e.g. adenocarcinoma, melanoma and bone, breast and liver cancer), autoimmune/inflammatory disorders (e.g. Acquired Immune deficiency Syndrome (AIDS), anaemia, asthma, Crohn's disease and multiple sclerosis) and reproductive disorders (e.g. tubal disease, ectopic pregnancy and colycystic ovary syndrome). PKH, its catalytic or immunogenic fragment are used for screening libraries of compounds in any of the drug screening techniques. PKH nucleic acids are used to generate hybridisation probes useful in mapping the naturally occurring genomic sequences. PKH are also used as antigens in the production of antibodies adainst protein kinases (PK) and in assays to identify modulators of PK expression and activity. PKH is also used in protein therapy

27-JUN-2002

This invention describes a novel protein kinase homologue (PKH)

comital pergic, antiachmatic, antiantenic, antithyroid, dermatological, antidabetic, nephrotropic, antiphrout.

compthal mological, antiducer, antiviral, antibacterial, antidungal, antiphronogal, antiparastic and antihelmintic activity. The polypeptide is used for treating a disease or condition associated with decreased expression of functional PKH The polypeptide is used for treating a capaired immunodeficiency syndrome (AIDS), Addison's disease, adult respiratory distress syndrome, allergies, ankylosing spondylitis, acquired immunodeficiency syndrome (AIDS), Addison's disease, adult respiratory distress syndrome, allergies, ankylosing spondylitis, anyloidosis, anaemia, asthma, atherosclerosis, autoimmune haemolytic canaemia, autoimmune thyroiditis, bronchitis, cholecystitis, cancer, contact dermatitis, Crohn's disease, atopic dermatitis, cancer, contact dermatitis, emphysema, atropic gastritis, glomerulonophitis, hyperessinophilla, irritable bowel syndrome, multiple sclerosis, hyperessinophilla, irritable bowel syndrome, multiple sclerosis, csteoarthritis, osteoporosis, pancreatitis, sclerosis, thrombocytopenic purpura, ulcerative colitis, uveitis, systemic sclerosis, thrombocytopenic concenter, haemodalalysis, and extracorporael circulation, viral benefity, protozoal, and helminthic infections, infertility, cholucystic protozoal, and helminthic infections, infertility, colucynentic colitis, uveitis, multiple menstrial colucing tubal disease, ovulatory defects, and endometricals. polycystic ovary syndrome, ovarian hyperstimulation syndrome, endometrial and ovarian tumours, uterine fibroids, autoimmune disorders, ectopic pregnancies, and teratogenesis. The polypeptides of the invention can be used for gene therapy. This sequence represents a PKH from clone ID 207669 isolated from TMLR3DT02, a library constructed using RNA isolated from non-adherent peripheral blood mononuclear cells collected from a pool of male and female donors Nucleic acids encoding a human protein kinase homolog useful for preventing, diagnosing and treating cancer, autoimmune/inflammatory disorders and reproductive defects. ```
Fused polypeptide - has amino acid sequence of beta-galactosidase with a LCK gene conjugated to the N-terminal via DNA having multi-cloning site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence consists of the N-terminal amino acids of the beta-galactosidase gene fused with the lck gene. It is produced by E.coli transformed with a recombinant vector (see AAQ13983). It is useful for producing an antibody specifically immunoreactive with only a lck genederived polypeptide in T cells. The antibody may recognise lck genederived polypeptides in human cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; splice variant; tumour-involved gene; TIG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention discloses isolated human nucleic acid alternative splicing variants that are all tumour-involved genes (TIGS). The nucleic acids and polypeptides are useful for determining the level of a nucleic acid or polypeptide in a biological sample, for detecting a variant nucleic acid or polypeptide sequence in a biological sample, for determining the level of variant sequence in a first biological sample and the level of variant sequence from which the variant has been varied by alternative splicing in a second biological sample and for raising antibodies. A pharmaceutical composition comprising antibodies. A pharmaceutical composition comprising antibodies. A pharmaceutical composition comprising a crarier and the nucleic acid, is useful for treating diseases (e.g. cancer) that can be ameliorated or cured by composition comprising the level of the encoded protein. The nucleic acids are also useful for diagnostic purposes, especially for detecting cancer or a predisposition to cancer, for evaluating the state or aggressiveness of cancer disease, in basic research, for understanding the physiological function of the original TIG in targeting or development of the original TIG in targeting or development of the same type of cells which may be helpful for the development of physiological functions and stages in which cell cycle is noncommal, for determining mutations in tumour-involved genes and in gene therapy. The polypeptides are useful for identifying compounds capable of therapy. The polypeptides are useful for identifying compounds capable of modulating endothelial differentiation and proliferation, as well as to modulate apoptosis either ex vivo or in vivo. The sequences presented in dispersed the new variants (NV) 1-36 proteins of the TIGs
                                                                                                                                                                                                                                                          Novel nucleic acid sequence, which is an alternative splicing variant of tumor involved genes, useful for detecting cancer, predisposition to cancer, for evaluating cancer state and in gene therapy for treating
                                                                                                                                                      Bernstein J;
                                                                                                                                                                                                                                                                                                                                                                         Claim 4; Page 68-69; 180pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel isolated polypeptide which is a human kinase and phosphatase (KPP). The KPP polypeptides, polynucleotides, gonists and antagonists are useful for diagnosing, treating or preventing cell proliferative disorders such as atherosclerosis, cirrhosis, hepatitis and cancer, developmental disorders e.g. mental retardation, neurological disorders including Alzheimer's disease and Parkinson's disease, autoimmune and inflammatory disorders such as Crohn's disease and diabetes mellitus and finally, viral, bacterial, fungal, parasitic, protozoan or helminthic infections. Furthermore, the polymucleotides encoding KPP may be useful for creating transgenic animals to model human disease, as well as during gene therapy procedures. The current sequence is that of the human KPP protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human kinases and phosphatases and polynucleotides, useful for diagnosing, treating or preventing autoimmune or inflammatory disorders (e.g. AIDS, allergy or anemia), multiple sclerosis, osteoarthritis,

diffracts X-rays so that the atomic coordinates of the protein-ligand comprising a truncated lymphocyte kinase [1ck] and a ligand. The crystal diffracts X-rays so that the atomic coordinates of the protein-ligand complex can be determined to a resolution of greater than 5.0 Angstroms. The truncated lck used in the present invention comprises the globular core of the corresponding full-length lck. The present sequence is the full-length human lck protein. The crystal of the present invention may be used to identify kinase inhibitors in screening assays, in drug screening and drug design processes, to design, select or test inhibitors of kinase enzymes, where the inhibitors are used as therapeutics for the treatment and modulation of diseases, disease symptoms or the effect of other physiological events mediated by kinases, having one or more kinase enzymes involved in their pathology
                                                                                                                                                                                                                                                                                                                                                                                                    Crystal of a protein-ligand complex for identifying kinase inhibitors, comprises a truncated lymphocyte kinase and a ligand, and diffracts X-rays to determine atomic coordinates at a resolution greater than 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a crystal of a protein-ligand complex

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal composition and polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more pain and a pharmaceutical composition comprising the one or more pain and a pharmaceutical composition comprising the one or more polynpeptides or their antibodies. The polynucleotide or the compound that complete in a sectivity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed the sequence data for this patent did not form and the data for this patent did not form and the data for this patent did not form and the data for the sequence data for this patent did not form and the data for the sequence data for this patent did not form and data for the sequence data for this data for the sequence data for this data fo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, pain, neuronal tissue, gene therapy,

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for identifying a compound useful in the specification, a method for identifying a compound useful in the cativity in an animal of one or more of the polypeptides given in the cativity in an animal of one or more of the polypeptides given in the cativity in a method for identifying a compound useful in treating and a compound the cativity in an animal of one or more of the polypeptides given in the cativity in a method for identifying a compound useful in treating and a cativity in a method for identifying a compound useful in the cativity in a method for identifying a compound useful in treating and a cativity or method for identifying a compound useful in treating and a cativity in an animal composition or man and an animal composition or man a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that preferentially bind to inactive conformation of a target protein kinase. The present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; immunosuppressive; antiinflammatory; antibacterial; virucide; fungicide; nootropic; neuroprotective; kinase inhibitor; crystal; protein-ligand complex; lymphocyte kinase; Lck; Lck ligand; kinase inhibitor; therapeutic; kinase-mediated physiological event; cancer; autoimmunological; metabolic; niflammatory; infection; central nervous system degenerative disease; transplant rejection; human; globular core; protein co-ordinate data.
                                                                                                                                                                                                                                                                                                                    Identifying ligand binding to inactive conformation of target protein kinase (T) comprises contacting the conformation modified (T) which contains reactive group at binding site, with ligands and detecting kinase-ligand conjugate formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                  Comprising a truncated lymphocyte kinase (Lck) and a ligand, where (I) effectively diffracts X-rays for determination of atomic coordinates of (C) to a resolution of greater than 5.0 angstroms, and truncated Lck (C) to a resolution of greater than 5.0 angstroms, and truncated Lck (C) to a resolution of greater than 5.0 angstroms, and truncated Lck (C) to a resolution of greater than 5.0 angstroms, and truncated Lck comprises a sequence (S1) of residues 225-508 of a 508 amino acid (C) to a resolution of residues 225-508 of a 508 amino acid (C) to a resolution of sequence, given in specification and retains the globular core of full-length Lck. (I) is useful in an inhibitor screening assay and to identify, design, select, and evaluate potential inhibitors of kinases continued by the methods may also be useful for inhibition of that are associated with kinase-mediated physiological events. The inhibitors identified by the methods may also be useful for inhibition of kinase activity of one or more enzymes. The inhibitors are also useful for inhibiting the biological activity of any enzyme comprising greater than 70% sequence homology with a kinase sequence. The inhibitors are useful correction in treating disease or disease symptoms mediated by any enzyme that binds ATP. The inhibitors are useful in inhibiting kinase activity and mammal, particularly a human e.g., cancer; tungal, etc.), central mammal, particularly a human e.g., cancer; tungal, etc.), central nervous system degenerative disease etc. The inhibitors are useful in treating or preventing diseases, including, transplant rejection etc. This is the amino acid sequence of a human lymphocyte kinase (Lck) polypeptide comprising the Lck globular core.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                            Crystal of protein-ligand complex useful for identifying an inhibitor of lymphocyte kinase (Lck), comprises truncated Lck and a ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human protein of a TNF-alpha signalling pathway protein complex SeqID 3.

This invention relates to novel protein complexes of the tumour necrosis factor-alpha (TNF-alpha) signalling pathway. Specifically, it refers to methods for preparing these complexes comprising at least two component proteins, as well as screening methods to identify modulators of the proteins, as well as screening methods to identify modulators of the pathway, which include antibodies, agonists and antagonists thereof. The creating complex and kit that are useful for diagnosing, prognosing or treating chronic inflammatory diseases such as recording arthritis and inflammatory bowel disease; infectious diseases cut as septic shock and bacterial infections; neurodegenerative diseases such as stroke-induced inflammation in neurons; neurodegenerative diseases and cancer. Accordingly, these complexes can be used for the development of pharmaceutical compositions that exhibit antihiflammatory, antiarthritic, antirheumatic, cytostatic and antibacterial activities and can be used for gene therapy purposes. In particular, the invention further provides is alkNA-oligonucleotides useful for inhibiting protein expression for in vitro or cell culture assays. This polypeptide is a human protein that can be used in combination with other proteins provided in the specification to form novel complexes of the TNF-alpha signalling pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                The invention provides a novel method of altering the activity of the protein kinase A (PKA) signaling pathway in a cell that comprises a letering the extent of phosphorylation of one or more PKA substrates, or kinase substrates downstream in the PKA signaling pathway. Pharmaceutical compositions containing a nucleic acid molecule that encodes a PKA compositions containing a nucleic acid molecule that encodes a PKA substrate, or fragment, precursor or functionally equivalent variant, where the sequence is modified to alter its susceptibility to phosphorylation by PKA can be used for treating a disorder exhibiting abnormal PKA signaling activity, immunosuppressive disorders or proliferative diseases. They can be used for treating e.g. HIV infection, ALDS, common variable immunodeficiency or cancers. Conditions in which upregulation of the PKA pathway is required, such as autoimmune disease, e.g. systemic lupus erythematosus, may also be treated. The present sequence represents a PKA substrate, wherein the substrate is in the Srcfamily, preferably Lck, Fyn, Src, Yes, Fgr, Lyn, Hck Blk, Yrk, C-tkl, Fyk, Src-1 or Src-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                Altering the activity of protein kinase signaling pathways, used for treating immunosuppressive disorders, e.g. AIDS, proliferative disorders, e.g. cancers or autoimmune diseases.

The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-cregulated in specific cancers (e.g. about 1031 genes up-regulated in a cutte lymphocytic leukemia). ACC7241 to ACC72860 represent cancer related gene nucleotide sequences which encode the proteins given in ARRS851 to ARRS8709. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically trargeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a cut greening a pathology, e.g. cancer (e.g. cancer of the bone marrow, therapeutic targets. In particular, the nucleic acid is useful for the appending a pathology, e.g. cancer (e.g. cancer of the bone marrow, bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, canceres, prostate, skin and uterus), wounds, ischaemia, heart diseases, atherosclerosis and endometriosis. The nucleic acid is also useful in the care of the processing these actives are treating these
                                                                                                                                                                                                                                                                                                                                                                                  New genes that are up-regulated or down-regulated in cancers, useful markers for diagnosing e.g. cancer, ischemia or heart diseases, or as therapeutic targets for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, protein co-ordinate data, Lymphocyte Cell Kinase; Lck; enzyme; Src-family protein tyrosine kinase; T-cell; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a compound capable of diagnosing, preventing or treating AIDS or an HIV-related disorder comprises assaying the ability of the compound to modulate e.g. 1414, 1481 or 1553 nucleic acid expression or polypeptide activity.
                                                     catalytic
                                                                                                                                    protein. Lck is a Src-family protein tyrosine kinase expressed primarily in T-cells and plays an essential role in immune response. The present sequence is the full-length sequence of human Lck (1-509). (1) is useful for identifying a compound which is an inhibitor of human Lck protein
                                                                                                                                                                                                                                                                                                                                                                                                              AIDS; acquired immunodeficiency syndrome; human immunodeficiency virus; HIV-related disorder; differential expression; drug screening; viral replication modulation; diagnosis; prognosis; predisposition; anti-HIV; gene therapy; antiesense therapy; human; proto-oncogene Tyr protein kinase LCK; enzyme.
                                                               당
 Hrnciar P, Loew A;
                                                                                                                 The present invention relates to a crystalline polypeptide (1), comprising the catalytic domain of human Lymphocyte Cell Kinase (Lck)
                                                                                                                                                                                                                                   Gaps
                                                  New crystalline polypeptide comprising ligand binding domain or cat domain of Lck protein, for determining three-dimensional structure catalytic domain of Lck, has predetermined unit cell parameters.
                                                                                                                                                                                                                                                                                                                                                                                           Human proto-oncogene Tyr protein kinase LCK (gene ID 1611) protein.
                                                                                                                                                                                                                                   ;

The invention relates to a method of identifying a compound useful in the treatment of AIDS (acquired immunodeficiency syndrome) or an HIV (human immunodeficiency virus). Felated disorder. The invention involves assaying the ability of a test compound to modulate the activity or expression of 26 human proteins. These proteins and nucleic acids encoding them (ADE40422-ADE40473) are differentially expressed in tissues relating to AIDS or an HIV-related disorder compared to their expression in normal tissues. The invention also relates to the use of the compounds identified to modulate viral replication in a cell and to treat a patient with AIDS or an HIV-related disorder. The invention further discloses methods for the diagnostic evaluation and prognosis of various HIV-related disorders, and for the identification of individuals exhibiting a predisposition to such conditions. The modulatory compounds identified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of identifying a candidate p21 or p53 pathway modulating agent. This comprises providing an assay system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               using the method of the invention may be small organic molecules, peptides, antibodies or antisense nucleic acid molecules. The methods of the invention are useful in diagnosing, preventing or treating AIDS or HIV-related disorders. The present sequence represents a human protein which is differentially expressed in AIDS or HIV-related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a candidate p21 or p53 pathway modulating agent using an assay system having a modulator of p21 or p53 (MP2153) polypeptide or nucleic acid, useful for diagnosing or treating cancer, such as colon

acid, contacting the assay system with a test goett, where in its presence the system provides a reference activity, and detecting a test agent-biased activity of the assay system, wherein a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p21 or p53 pathway modulating agent. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of diseases or conditions associated with aberrant expression or activity of the p21 or p53 pathway, such as cancer, preferably colon or head and neck cancer. The present sequence is a human MP2153 protein sequence of the invention.

Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of the genes

Claim 65; SEQ ID NO 2467; 1762pp; English.

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, according to mechanical transplant rejection, and individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The invention relates to a compound targeted to a nucleic acid molecule encoding the human lymphocyte specific tyrosine kinase (Lck) polypeptide. The compound is an antisense oligonacleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Lck polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a human Lck polypeptide of the invention.
                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotide compounds, useful for diagnosing, preventing and/or treating diseases or conditions associated with aberrant expression or activity of Lck, such as hyperproliferative
                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                              Human lymphocyte specific tyrosine kinase (Lck) polypeptide #1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes a method for identifying protein kinase inhibitors that preferentially bind to the inactive conformation of a target protein kinase. The inhibitors are identified by locking the target protein kinase. The inhibitors are identified by locking the identify inhibitors preferentially targeting the inactive conformation, and using Tethering to identify inhibitors preferentially targeting the inactive conformation. The method of the invention is useful for identifying a ligand which binds to an inactive conformation of a target protein kinase. The present sequence represents the human Tyr kinase Lck. Lck variants were used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                      protein kinase inhibitor; inactive conformation; Tethering; Tyr kinase;

The invention relates to a method (M1) for identifying, selecting and/or characterizing a compound which modulates Src family kinase (SFK) activity, by expressing nucleic acids encoding SFK or mutated SFK in cells, contacting cells with test compound and determining whether phenotype of cells is changed as compared with phenotype of cells not expressed with above nucleic acids, where difference in phenotype of cells in didentified, selected and/or characterized by (M1); and (2) a compound (I) identified, selected and/or characterized by (M1); and (2) a pharmaceutical composition (PC1) containing (I), and a carrier, adjuvant or vehicle. (I) is useful as a medicament, particularly for the treatment of diseases, which are at least in part caused by a Src family kinase.

(I) and PC1 are useful for producing a medicament for the treatment of diseases, which are at least in part caused by a Src family kinase, particularly by a dysfunction of a Src family kinase, in particular cancer, hypercalcemia, restenosis, osteoporosis, osteoparthritis, symptomatic treatment of bone metastasis, rheumatoid arthritis, symptomatic treatment of beautiful services.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying compound which modulates Src family kinase (SFK) activity, by contacting cells expressed with SFK or mutated SFK with test compound, where change in phenotype of cells indicates that test compound modulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inflammatory bowel disease, multiple sclerosis, psoriasis, lupus, graft versus host disease, T-cell mediated hypersensitivity disease, Hashimoto's thyroiditis, Guillain-Barre syndrome, chronic obstructive pulmonary disorder, contact dermatitis, Paget's disease, asthma, ischemic or reperfusion injury, allergic disease, atopic dermatitis, transplant rejection or allergic rhinitis. The present sequence represents human Lck kinase, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Shen F; S.J. Elder LV;

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conditions also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm Sequence 539 AA;

"tkl is the avian homolog of the mammalian lck tyrosine protein kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: Phosphorylated on Tyr-503. This phosphorylation downregulates catalytic activity. Phosphorylated on Tyr-392 either by itself or another kinase, leading to increased enzymatic activity. SIMILARITY: Belongs to the Tyr protein kinase family. SRC
                                                                                                                                                                                Gallus gallus (Chicken).

C --- FUNCTION: Tyrosine kinase that plays an essential role for the mature in a maturation of developing T-cell in the thymus and in mature T-cell function. Is constitutively associated with the cytoplasmic portions of the CD4 and CD8 sufface receptors and plays a key role in T-cell antigen receptor(TCR)-linked signal transduction pathways. Association of the TCR with a peptide antigen-bound MHC complex facilitates the interaction of CD4 and thereby recruits the associated LCK to the vicinity of the TCR/CD3 complex. LCK then phosphorylates tyrosines residues within the immunoreceptor tyrosines-based activation motifs (ITAMs) in the

cytoplasmic tails of the TCRgamma chains and CD3 subunits, initiating the TCR/CD3 signaling pathway. In addition, contributes to signaling by other receptor molecules. Associates directly with the cytoplasmic tail of CD2, and upon engagement of the CD2 plays a role in the IL2 receptor-linked signaling pathway that controls T-cell proliferative response. Binding of IL2 to its receptor results in increased activity of LCK. Is expressed at receptor results in increased activity of LCK. Is expressed at all stages of thymocyte development and is required for the regulation of maturation events that are governed by both pre-TCR and mature alpha beta TCR (By similarity).

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                                     Uprosine phosphate.

SUBUNIT: Binds to the cytoplasmic domain of cell surface receptors, such as CD2, CD4, CD5, CD8, CD4, CD5, and CD122. Also binds to effector molecules, such as P14K, VAVI, RASAI, FYB and to other proteins kinases including CDC2, RAFI, ZAP70 and SYK. Binds to phosphatidylinositol 3'-kinase (P13K) from T lymphocytes through its SH3 domain and to the tyrosine phosphorylated form of RHDRBSI/P70 through its SH2 domain. Interacts with SQSTM1.
                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Cytoplasmic and attached to the membrane. Present in lipid rafts in an unactive form (By similarity). DOMAIN: The SH2 domain mediates interaction with SQSTM1. Interaction is regulated by Ser-58 phosphorylation (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proto-oncogene tyrosine-protein kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ATP-binding, Kinase, Lipoprotein, Membrane, Myristate,

5. Selection and maturation of developing T-cell in the thymus and in mature T-cell function. Is constitutively associated with the cytoplasmic portrions of the CD4 and CD8 surface receptors and plays a key role in T-cell antigen receptor (TCR) linked signal transduction pathways. Association of the TCR with a peptide antigen-bound MHC complex facilitates the interaction of CD4 and CD8 with MHC class II and class I molecules, respectively, and thereby recruits the associated LCK to the vicinity of the TCR/CD3 complex. LCK then phosphorylates tyrosines residues within the complex. LCK then phosphorylates tyrosines residues within the cytoplasmic tails of the TCR/CD3 signaling pathway. In addition, contributes to signaling by other receptor molecules. Associates directly with the CYtoplasmic tail of CD2, and upon engagement of the CD2 molecule, LCK undergoes hyperphosphorylation and activation. Also plays a role in the LI2 receptor molecules. Secondared at 11 receptor results in increased activity of LCK. Is expressed at all stages of thymogenes the required for the regulation of the required for the regulation and is required for the regulation and section of the regulation and section and section of the regulation of the regulation and section of the regulation of the regulation and section of the regulation of the regulation of the regulati

SUBUNIT. Binds to the cytoplasmic domain of cell surface
1. SUBUNIT. Binds to the cytoplasmic domain of cell surface
1. SUBUNIT. Binds to the cytoplasmic domain of cell surface
1. SUBUNIT. Binds to the cytoplasmic domain of cell surface
1. SUBUNIT. Binds to the cytoplasmic domain of course to binds to effector molecules, such as PI4K, VAVI, RASAI, FYB and to binds to effector molecules, such as PI4K, VAVI, RASAI, FYB and to other proteins kinases including CDC2. RAFI, ZAP70 and SYK. Binds to phosphatidylinositol 3'-kinase (PI3K) from T lymphocytes
1. Chrough its SH3 domain and to the tyrosine phosphorylated form of KHDRBSI/p70 through its SH2 domain. Interacts with SQSTM1.

1. Chromatic and the phosphorylated LIMEI. Interacts with SQSTM1.

2. SUBCELDULAR LOCATION: Cytoplasmic and attached to the membrane.
2. Present in lipid rafts in an unactive form (By similarity).
2. Interacts with Sapersed specificaly in lymphoid cells.
3. Chromatic and attached to the membrane.
3. Chromatic and attached to t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         stages of thymocyte development and is required for the regulation of maturation events that are governed by both pre-TCR and mature alpha beta TCR (By similarity).

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DOI=10.1128/JVI.75.19.9252-9261.2001;

                         -!- PTM: Phosphorylated on Tyr-504 presumably by CSK. This phosphorylation downregulates catalytic activity. Phosphorylated on Tyr-393 atther by itself or another kinase, leading to increased enzymatic activity.
-!- SIMILARITY: Belongs to the Tyr protein kinase family.
-!- SIMILARITY: Contains 1 SH2 domain.
-!- SIMILARITY: Contains 1 SH3 domain.
-!- GAUTION: LCK seems to be active in all vertebrates, except in squirrel monkey T-cells, in which it is inactivated. The reason seems to be that squirrel monkey are the natural host for Saimirine herpesvirus 2, which is able to efficiently transform F-cells through a mecanism involving viral Tip/ host LCK interaction. Its inactivation may a mecanism that specificaly counteracts the transformation effects of viral Tip.
